City of Falls Church Sewer Rehab Project Underway

The City of Falls Church has begun its annual sanitary sewer rehabilitation project. The project is part of the Department of Environmental Services Public Utilities Division's Comprehensive Sanitary Sewer System Improvement Plan developed in 2003 which outlines a phased program of sewer system evaluation and rehabilitation. This rehabilitation extends the life of the existing sewer mains and, by reducing the amount of inflow of storm water and ground water, is expected to reduce the treatment costs paid by the City.

The project began in late February when AM-Liner East, Inc began inspecting the sewer lines to be rehabilitated.

The rehabilitation project will include lining approximately 8,800 linear feet of sewer main with polyester resin on the following streets: Berry Street, Cleave Drive, Fulton Avenue, Greenwich Street, Gordons Road, Lincoln Avenue, Meadow Lane, North Oak Street, North West Street, Shady Lane, South Street, South Maple Avenue, South Washington Street and Tinner Hill Street.

The second phase of the project, which involves the insertion of a new liner into the sewer main, is expected to begin sometime in mid-March and continue through the end of April. Customers will be notified and provided with more detailed information shortly before the sewer line serving their residence is scheduled for rehabilitation.

For more information about this project, contact the Public Utilities Division at 703-248-5070 (TTY 711).
